

LumiNode / LumiCore

RELEASE NOTES

VERSION 2.4.2

DOCUMENT INFORMATION

This document lists the new features, improvements and bug fixes available in the new LumiNode & LumiCore firmware version 2.4.2.

NEW FEATURES

- Added initial support for the LumiNode12 RJ45.
- Added initial support for the LumiNode4 Wall.
- Configuration of multiple input network interfaces (Groups/VLAN) can now be achieved via the web API.
- Added legacy Ethernet-DMX compatibility mode to match old trigger values in Mux/Switch mode see ``/api/ethdmx_compatibility``.

UI IMPROVEMENTS

- Added a Reboot button in the Webinterface.
- The toggle switch “preserve IP settings” for a profile recall, was moved to a more accessible location.

BUG FIXES

- Correction for DMX input timing on port 5-12 of the LumiNode12.
- Added validation so there is no longer a way to assign a DMX output to the input slot of a process engine.
- Validation of network gateways now checks that the gateway is part of the local network.
- When in advanced networking mode, show ‘advanced network’ on the LCD during identify instead of old IP.
- Improved FW upgrade process to allow a second attempt after 120s, after an interrupted initial file upload.
